System Calls Programming

Aim: To experiment system calls using fork(), execlp() and pid() functions.

Algorithm:

1. **Start**
   - Include the required header files (stdio.h and stdlib.h).
2. **Variable Declaration**
   - Declare an integer variable pid to hold the process ID.
3. **Create a Process**
   - Call the fork() function to create a new process. Store the return value in the pid variable:
     - If fork() returns:
       - -1: Forking failed (child process not created).
       - 0: Process is the child process.
       - Positive integer: Process is the parent process.
4. **Print Statement Executed Twice**
   - Print the statement:

     scss
     Copy code
     THIS LINE EXECUTED TWICE

     (This line is executed by both parent and child processes after fork()).

5. **Check for Process Creation Failure**
   - If pid == -1:
     - Print:

       Copy code
       CHILD PROCESS NOT CREATED

     - Exit the program using exit(0).
6. **Child Process Execution**
   - If pid == 0 (child process):
     - Print:
       - Process ID of the child process using getpid().
       - Parent process ID of the child process using getppid().
7. **Parent Process Execution**
   - If pid > 0 (parent process):
     - Print:
       - Process ID of the parent process using getpid().
       - Parent's parent process ID using getppid().
8. **Final Print Statement**
   - Print the statement:

     objectivec

(This line is executed by both parent and child processes).

9. **End**

Program:

```c
#include <stdio.h>
#include <stdlib.h>
int main()
{
  int pid;
  pid = fork();
  printf("\n This line executed twice ");
  if (pid==-1)
    {  printf("\n child process not created \n");
      exit(0);
    }
  if (pid==0)
    {
      printf("\n IAM CHILD PROCESS AND MY ID IS %d \n", getpid());
      printf("\n THE CHILD PARENT PROCESS ID IS: %d \n", getppid());
    }
  else
    {
      printf("\n IAM PARENT PROCESS AND MY ID IS : %d \n", getpid());
      printf("\n THE PARENTS PARENT PROCESS ID IS: %d \n", getppid());
    }
  printf("\n IT CAN BE EXECUTED TWICE");
  printf("\n");
}
```

Output:

```
THIS LINE EXECUTED TWICE
I AM PARENT PROCESS AND MY ID IS : D150
THE PARENTS PARENT PROCESS ID IS 1781
IT CAN BE EXECUTED TWICE

THIS LINE EXECUTED TWICE
IA M CHILD PROCESS AND MY ID IS 2151
THE CHILD PARENT PROCESS ID IS : 1
IT CAN BE EXECUTED TWICE
```

Result:

Thus the C program for system calls programming is executed successfully
